

TITAN FLOW CONTROL, INC.

INSTALLATION, OPERATION, AND MAINTENANCE

PREFACE:

This manual contains information concerning the installation, operation, and maintenance of Titan Flow Control (Titan FCI) Tri-Flow Control Check Valves. To ensure efficient and safe operation of Titan FCI Tri-Flow Control Check Valves, the instructions in this manual should be thoroughly read and understood. This manual is general in nature and is not meant to take the place of an on-site, process engineer or pipe fitter. As such, Titan FCI recommends that only experienced, skilled personnel be allowed to install and maintain Titan FCI Tri-Flow Control Check Valves. Please retain this manual in a location where it is readily available for reference.

GENERAL INFORMATION:

A Tri-Flow Control Check Valve is a heavy-duty, pump protection device that is installed on the discharge side of a pump. In this position, the Tri-Flow Valve provides all the functions normally required on the discharge side of a pump including: a spring loaded silent check valve, a balancing valve, and a shut-off valve. The disc of the Tri-Flow Valve is designed to automatically open (with as little as 1/2 psi line pressure) to allow system flow and shut (when line pressure reaches zero) to prevent flow reversal and water hammer.

Specific engineering design data, not contained in this manual, may be located within the TF21 Tri-Flow Control Check Valve Specification Sheet or on a certified Engineering drawing available by request.

Prior to selection of a Titan FCI Tri-Flow Control Check Valve, the following factors must be determined:

- Material construction requirements of the Tri-Flow valve.
- Design and working pressure/temperature requirements.
- Operating conditions (throttling, pressure drop, condensation, flow reversal, operation frequency, etc.).
- Service media type (liquid, gas, abrasive, corrosive, dirty, etc).
- Pipeline Media Flow-rate and Viscosity.
- Clean Start-up Pressure of the Pipeline.
- Space availability for installation.

Please contact a Titan Design Engineer to assist in the determination of these requirements prior to selection and purchase.

UNPACKING AND INSPECTION:

Upon receipt of product, it is important to follow these unpacking and inspection procedures.

All Titan FCI Tri-Flow Control Check Valves are shipped in specialized shipping containers designed to prevent damage during transportation. If external damage to the shipping container is evident upon receipt of product, please request that a representative of the shipping carrier be present before unpacking the product.

- Carefully open the shipping container, following any instructions that may be marked on the container. Remove all packing material surrounding the Tri-Flow Valve and carefully lift it from the container. It is recommended to keep the shipping container and all packing material for reuse in storage or reshipment.

CAUTION:

For large or heavy Tri-Flow Control Check Valves, the appropriate material handling equipment must be used to prevent injury and possible damage to the Tri-Flow Control Check Valve.

INSTALLATION, OPERATION, AND MAINTENANCE

UNPACKING AND INSPECTION: Continued...

- Visually inspect the Tri-Flow Valve for any signs of damage including scratches, loose parts, broken parts or any other physical damage that may have occurred during shipment. If damage is observed, immediately file a claim with the shipping carrier. Tri-Flow Valves that are damaged during transportation are the responsibility of the customer. For information regarding Titan FCI's warranty policy, please refer to the last page of this document.
- Before installation, remove the flange protectors from the Tri-Flow Valve and inspected it internally for any loose or foreign materials that may have become trapped inside the Tri-Flow during transportation.
- If the Tri-Flow Valve is not required to be installed immediately, it should be stored indoors in a clean, dry, consistent temperature environment. It is also recommended to utilize the original shipping container and packing materials to properly store the Tri-Flow Valve. If long term storage is required, a desiccant may be necessary. This would be based upon the local, environmental storage conditions. Please consult a Titan FCI Design Engineer to assist in this determination.
- When ready to install, remove any preservatives with solvent dampened cloths. Remove any loose material and protective packing material.

INSTALLATION:

Pre-Installation Checklist

- Ensure Working conditions (pressure and temperature) are within the specified capacity of the product being installed. Please refer to the certified Engineering drawings to assist in determining these values.
- Make sure that the construction material of the Strainer is chemically compatible with the media flowing in the pipeline.
- Inspect the Tri-Flow Control Check Valve's flange ends and the pipeline's mating flanges to ensure gasket surfaces are clean and free of defects. The pipeline should also be checked for proper alignment. Titan FCI Tri-Flow Control Check Valves should never be utilized to realign an existing piping system.

Figure 2: Illustration of Installed Tri-Flow Valve with Pump

Pre-Installation Checklist continued...

- Ensure that the pipeline's mating flanges are the same type as the Tri-Flow Control Check Valve being installed. Raised face flange ends cannot be mated to flat face flange ends.
- Ensure the gap for product installation and Tri-Flow Valve's end to end length are within $\frac{1}{4}$ " gap for gasket installation. Also, check for sufficient clearance around the Tri-Flow Valve for maintenance operations.
- The appropriate handling equipment (joist and slings) should be available to lift larger units into position.

Installation Procedure

Step 1:

The Titan FCI Tri-Flow Valve may be installed in either the vertical or horizontal position on the discharge side (outlet) of the pump. In the vertical position the stem must be pointing up and in the horizontal position the stem must be pointing up and away from the pump.

TITAN FLOW CONTROL, INC.

Installation Procedure continued...

Step 2:

Place the Tri-Flow Valve into position, using the appropriate material handling equipment for large or heavy units. Ensure that the flow arrow (cast into the Tri-Flow Valve) is pointed away from the pump and the stem is pointing upward.

CAUTION:

Titan FCI does not recommend mounting a Tri-Flow Valve directly to the pump. Not to be used with eccentric reducer on inlet side.

Step 3:

Before proceeding, ensure that there is ample space around the Tri-Flow Valve to allow for maintenance operations.

Step 4:

For large Tri-Flow Valves, it is recommended to support the existing pipeline with pipe supports near the inlet and outlet connections before attempting installation.

Step 5:

Install a standard, ANSI (1/8" thick) flange gasket between the Tri-Flow Control Check Valve and pipeline flanges, on both sides. Install lubricated flange bolts and hand tighten. Flange bolts should then be tightened, using a star or crisscross pattern to evenly load the bolts, in accordance with established piping standards. This is illustrated in Figure 3.

Figure 3: Bolting Sequence Pattern

CAUTION:

Excessive bolt torque may damage flanges. Please refer to established flange bolt torques for guidelines.

INSTALLATION, OPERATION, AND MAINTENANCE

OPERATION:

Once proper installation has been successfully completed, start the system gradually, at start up as well as after shut down. This eliminates sudden shock to the strainer and other equipment in the line.

Start-up Procedure:

CAUTION:

Start system gradually, at start up as well as after shut down. This eliminates sudden shock to the Tri-Flow Valve and other equipment in the line. This is **EXTREMELY** important for steam service.

Step 1:

Tri-Flow Valve's are shipped in the closed position, therefore slightly open the Tri-Flow Valve before starting the system. Once system is started, gradually adjust the disc opening (via the hand wheel) until the desired flow and pressure drop is reached. Titan FCI recommends installing pressure gauges on either side of the Tri-Flow Valve to assist in determining the pressure differential.

Step 2:

Inspect flange connections for leaks. If leaking occurs, ensure that the flange bolts are properly tightened and check for piping misalignment.

Step 3:

For future reference, make a note of the disc position as indicated by the graduated position indicator located on the rising stem.

YOUR PIPELINE TO THE FUTURE!

290 Corporate Drive ♦ PO Box 7408 ♦ Lumberton, NC 28358

MAINTENANCE:

Titan Flow Control Tri-Flow Control Check Valves are designed to require very little maintenance. Regular maintenance involves:

- Periodically checking for leaks.
- Replacing packing as needed.

Packing Replacement

Step 1:

As mentioned earlier, make a note of the proper disc position as indicated on the graduated position indicator located on the rising stem before beginning the procedure.

Step 2:

Shut down the pump and slowly close the upstream and downstream isolation valves to isolate the Tri-Flow Valve. Make sure the isolation valves are bubble tight.

Step 3:

Continue to open the valve (via the hand wheel) until the “stem back” meets the top of the yoke housing assembly. In this topmost position, the valve is now completely open.

Step 4:

Remove the flange gland (located on the cover) by loosening the two nuts and takeout the existing packing. Additionally, clean out any debris or sludge that may have accumulated in the packing cavity.

Step 5:

Insert a new set of packing rings (generally three rings) into the packing cavity and press them into place. To provide a tight seal, the split on the packing rings should be staggered such that they do not overlap.

Step 6:

Replace the flange gland and evenly tighten the flange gland nuts. Exercise caution when tightening the flange gland nuts. Excessive force can cause the stem to seize.

CAUTION:

Variations in water chemistry can lead to corrosion inside the valve over time. This may result in disc sticking, internal wear, or occasional pressure surges. To prevent this, conducting regular water quality checks and treatments will help maintain optimal performance and prolong equipment life.

Packing Replacement: continued...

Step 7:

Adjust the disc opening to its previous position as indicated by the graduated position indicator located on the rising stem.

Step 8:

Open the isolation valves and restart the system.

CAUTION:

If leaking occurs around the packing, evenly tighten each flange gland nut a 1/4 turn until the leaking stops.

Internal Component Replacement

- *For internal component replacement, please contact a Titan Flow Control design engineer.*

CAUTION:

Before opening a Titan FCI Tri-Flow Valve, always ensure the pressure inside the vessel has been reduced to atmospheric via suction or venting. Failure to do so may result in serious bodily injury.

Additionally, ensure that the media flowing in the pipeline is known and any special handling precautions are understood. Please review the Material Safety Data Sheet (MSDS) for that specific fluid.

WARRANTY:

Seller warrants each of the products and parts sold hereunder, under normal use of service, and subject to user's compliance with any operating instructions and other directions given by seller, to be free from defects in materials or workmanship for a period of one year from date of shipment from seller's plant. Seller's liability, under this warranty, shall be limited to, at the seller's option, to repairing or replacing any such defective product FOB seller's plant in Lumberton, NC, and reimbursing purchaser for shipping costs, subject to the following: (1) Timely receipt of purchaser's written notice that such products are defective. (2) Seller's written authorization to purchaser for the return of such products, (3) the return of such products to seller with shipping charges prepaid and (4) seller's inspection of and confirmation that such products are defective in materials or workmanship. If seller's inspection shows that the products returned are defective due to dirt, rust or any foreign material not attributable to seller: improper usage, over tightening on threads, abuse or incorrect assembly in the field, or other cause not due to seller's improper manufacture, seller will, subject to purchaser's written authorization, repair or replace such products at cost. Seller's factory inspection and testing reports will be made available to purchaser upon request.

THIS WARRANTY IS IN LIEU OF ANY OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING ANY IMPLIED WARRANTY OF FITNESS OR MERCHANTABILITY. SELLER SHALL NOT BE LIABLE FOR ANY SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES. NO REPRESENTATIVE OR SELLER HAS AUTHORITY TO MAKE ANY REPRESENTATIONS OR WARRANTIES, EXCEPT AS STATED HEREIN.
