

Suction Diffuser Strainer SD 22-CI

Tri-flow Control Check Valve TF 21-CI

Pump Protection

*Titan Flow Control, Inc.
has quality products that you can
depend on, a guarantee that is
critical when considering the set-
up of expensive equipment within a
pump piping system.*

Titan's durable **Suction Diffuser** and **Tri-flow Control Check Valve** are essential to protecting and promoting the longevity of pumps. At the same time, these two products are an economical choice, designed specifically to save space, energy, and installation and maintenance time.

A Titan **Suction Diffuser**, while functioning as a strainer to prevent foreign particles from harming a pump, also has straightening vanes that reduce turbulence in the flow and alleviate stress and erosion on the pump. Titan manufactures each diffuser with a mesh start-up screen that can be removed after the diffuser's start up period. Just one Titan Suction Diffuser replaces three products in a typical pump set up: *an elbow, strainer, and an entry pipe.*

The **Tri-flow Control Check Valve** is a spring-loaded valve that can be adjusted from full flow to complete shut-off. With a graduated position indicator, Titan's Tri-flow is easy to adjust and control flow and its automatic shut-off helps to prevent waterhammer. The Tri-flow is three products in one as it takes the place of a *balance valve, shut-off valve, and check valve.*

Suction Diffuser

SD 22-CI • 90° Suction Diffuser Strainer • Flanged • ASME 125

High quality protection for pumps

Directly mounted to the inlet side of the pump, Titan's Suction Diffuser Strainer is crucial for protecting expensive pumps. Serving as a strainer, it prevents unwanted debris from entering pump. It also helps to increase the service life of the pump as the straightening vanes on the outlet side of the diffuser help to smooth turbulent flow before it enters the pump. An optional magnetic insert that attracts metallic particles is also available. The suction diffuser has cast in supporting pads that fit standard support feet so an additional pipe saddle is not necessary.

Energy efficient and economical design

Titan's Suction Diffuser takes the place of a strainer, reducing elbow, and an entrance pipe. In addition to these specific parts, using the suction diffuser reduces the amount of piping, welds, and bolts required in a traditional pump set-up. Not only is it economical as far as the initial investment, but time and money are saved on installation and servicing. The suction diffuser's minimal head loss, as a result of its large open area ratio, can yield savings in energy costs for many years. Straightening vanes on the outlet side of the diffuser help to maintain a smooth flow throughout the piping system decreasing pressure loss.

Easy to service

The suction diffuser comes with a convenient mesh start-up screen that can be removed after its initial introductory period, thus two screens are not necessary. Quick-open knobs minimize down time while servicing and provide easy access to the strainer. The standard NPT plug can be replaced with an optional blow down valve for easy cleaning.

TITAN

Tri-flow Valve

TF 21-CI • Tri-flow Control Check Valve • Flanged • ASME 125

Economical and convenient design

Titan's Tri-flow Control Check Valve is three valves in one, replacing a calibrated balance valve, shut-off valve, and silent check valve for a simplified and inexpensive way to control flow from a pump. Flow through the valve is adjustable from zero to full by the ACME rising stem. A graduated position indicator on the stem provides an accurate check of the valve's position for throttling service, and a hand-wheel is provided with all Tri-flow control check valves for ease of operation. The Tri-Flow also has a soft-seated, dovetail O-ring groove ensuring a bubble tight seal in the closed position.

Quick closure to reduce water hammer

Silent shut-off is achieved via the fully automatic, spring assisted disc that closes near zero flow velocity when functioning as a check valve. The soft seat and quick closure helps to prevent flow reversal, slamming, and surges.

Minimal head loss

The valve's body has a large body with at least a 2 to 1 ratio to connecting pipe. The disc's low cracking pressure reduces the amount of energy required to open the valve.

SERVICING

The mesh start-up screen in the suction diffuser should be removed after the initial start-up period. Regular screen cleaning is necessary to clear diffuser of foreign matter build up during normal use and to maintain a low differential pressure. An optional blow down valve is available to assist in screen cleaning.

The Tri-flow can be adjusted as necessary to control the flow. Regular servicing is not required although some parts, such as spring and O-Ring, should be inspected and replaced as needed.

CAUTION:

Variations in water chemistry can lead to corrosion inside the valve over time. This may result in disc sticking, internal wear, or occasional pressure surges. To prevent this, conducting regular water quality checks and treatments will help maintain optimal performance and prolong equipment life.
